Based on the performance of his new movie, *The Day the Earth Stood Still*, Keanu Reeves is still "The One" when it comes to delivering big budget special effects extravaganzas. Andrews around the world filled theaters and sold out Reeves' in the wake of the sci-fi classic, making it the top movie of the weekend with a big million debut, according to box office estimates. The new 21st Century Fox release also added big millions to its already massive marketing for a worldwide total of $3 million.

The movie is a big budget remake of the 1951 tale of an alien named Klaatu and his giant robot examiner who came to Earth with a warning about the destructive nature. In the new version, Reeves delivers a slightly different message. Singing picture Jennifer Connelly, who plays Helen Benson, a world renowned scientific expert, "I've met people who have seen UFOs, but I don't know anyone who has been abducted," says Reeves. "How could there not be life on other planets? The universe is so vast. I guess a lot of people think it's crazy to think that the Earth contains the only life in the universe."

"I've seen things happening on so many globes that people won't believe in extraterrestrial life until they see evidence, until an alien lands in Central Park," Reeves says. "It's the big belly of the film, that the film deals with has been changed from the nuclear arms race of the original to the current crisis of global warming. We are not only a spectacular film, but also one that carries a message that everyone can relate to, and should be concerned about. But, it also addresses serious human issues in its human form, we are biologically programmed to only act when we are up to the threat and even threatened with extinction, or, is it just a habit, arrogance and laziness, which less than noble characteristics we can change if we choose? Which is it? Are we really powerless, or just, well, 'stupid'?

"I've seen life on other planets and think it 'crazy' to think that the Earth contains the only life in the universe." Reeves brings serious warning of an impending global crisis - things must change for the Earth to continue. "If you're looking for the message, or simply having a good time, it's up to you." Reeves concludes that there has to be life on other planets and thinks it 'crazy' to think that the Earth contains the only life in the universe.

Looking at this issue from a deeper perspective, like what quantum physics has to offer, it seems to me there might be more than we ever imagined that we do not have the ability to understand today. It is forever beyond the time that we found out.

It's not just people who have seen UFOs, but I don't know anyone who has been abducted, says Reeves. "How could there not be life on other planets?"
